

Inheritance

Inheritance is one of the main concepts in the oops.

This concept help the code to access, use, modify function and data of one class to another.

Generally: parent class $\rightarrow$ child class

Types of Inheritance:

Single Inheritance

$A \rightarrow B$

multilateral Inheritance

$A \rightarrow B \rightarrow C$

Hierarchical Inheritance

$A \rightarrow B, A \rightarrow C$

Multiple Inheritance

$A, B \rightarrow C$

Hybrid Inheritance

To use this feature in Java we can use the "extends" keyword in the child class.

Syntax

```
class parent {
```

```
}
```

```
class child extends parent {
```

```
}
```

//_

We can not use multipul parent class to one child class like in python.

To Inherite from more than one class we can use "interface", "implement"

Syntax :

```
Interface a {
```

```
    . . . . .  
}
```

```
Interface b {
```

```
    . . . . .  
}
```

```
child  
class child: implement a, b {  
    . . . . .  
}
```
