

//_

Abstraction :

→ Hiding
⇒

It hides the implementation and processes of the function.

We use abstract keyword to use it

Syntax:

```
abstract class classname {  
    abstract void function();  
}
```

Function should not be defined in the ~~main~~ abstract class just creation like interface.

Polymorphism :

It means many types of function for same symbol / function etc.

There are two types:

Compile-time → method overloading

Run-time → method overriding

~~Some more~~
